The invention relates to antibodies, especially humanised antibodies (see AAW83031-37), recognising the Fas antigen. Such antibodies preferably comprise a heavy chain and a light chain including Furse (see AAW83042-2) from the heavy and light chains of HFEAT. Humanised antibodies are produced by CDR grafting. The antibodies are capable of inducing apoptosis in abnormal cells expressing Fas, and of
3B9 was positive. CDNA clones of the 3B9 light and heavy chains were cloned into pGEM7f+ and transformed into E. coli DH5-alpha. A light chain consolation was sequenced (AAQ83490) that encoded the protein given in AAR70189. 3 CDRs (AAR70195-97) were identified. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               - nsed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antibodies and proteins bind conserved epitope of Fas antigen – usec
to evaluate drugs in animal models and to treat Fas-associated diseases
e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HFETA, monoclonal antibody, mouse, Fas; humanised antibody; apoptosis; autoimmune disease; Hashimoto's disease; systemic lupus erythematosus; graft versus host disease; Sjogren syndrome; pernicious anaemia; Addison's disease; scleroderma; Goodpasture syndrome; Crohn's disease; sterility; rheumatoid arthritis; autoimmune haemolytic anaemia; myasthenia gravis; multiple sclerosis; Basedow's disease; thrombopenia purpura; insulin-dependent diabetes; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomernlar nephritis; complementarity determing region; CDR.

             evaluate, in animal models, treatments of diseases that involve Fas/Fas autoimmune disease (e.g. systemic lupus errthematosus, including autoimmune disease (e.g. systemic lupus errthematosus, Hashimoto a disease, e.g. systemic lupus errthematosus, Hashimoto and sisease, scleroderma, Goodpasture syndrome, pernicious anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myosclerosis, myapthy, glomenular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed). (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New DNA molecules encoding recombinant antibodies useful for treating IL4-mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Light chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermeltis; atopic dermeltis; atopic dermeltis; antopic assethma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a complementarity determining region (CDR) of the light chain variable region of murine interleukhar4 (IL-4) antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin B-mediated allorgic reactions e.g. allergic rhintis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock,
                                                                                                                                                                                                                                                                                                                           Gaps
inhibiting Fas-induced apoptosis in normal cells. They are used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a light chain complementarity determining region (CDR) from an antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft
rheumatoid arthritis, host-vergus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, which is useful for the lymphocytes from cells to be used in bone marrow transplantation of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived complementarity determining region CDR-1 protein fragment which is used to illustrate the method of the invention
                                                                                                              Cluster differentiation; cell separation; antibody; CD4; CD34; leukemia; hematopoietic; undifferentiated; lymphocyte; bone marrow transplantation; HIV infection; autoimmune disease; complementarity determining region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.
                                                                  Murine CD4/CD34 recognizing antibody light chain CDR-1 region #1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autolmmune diseases, contains anti-Fas antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulomephritis, aplactic anaemia (pammyelophthiais), hepatitis, AIDS and organ graft rejection. Sequences AAB14744-B14746 represent CDRs 1-3 of the light chain of the murine anti-human Fas monoclonal antibody HFE7A, which is produced by hybridoma HFE7A (FERM-BP-5828)
                                                                                                                                                                                                                                                                                                                                                 Anti-Fas antibody, monoclonal antibody HFE7A, FERM-BP-5828, murine, complementarity determining region, CDR, human Fas; Fas ligand; apoptosis modulator; programmed cell death, autoimmune disease, allergy, atteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel humanized anti-Fas antibody-like

molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

candiand sits ligand. The products of the invention have anti-inflammatory,

anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,

canti-anemic, nephrotropic, anti-allergic, anti-arthritic, antiviral,

antiarteriosclerctic, cardiant and hepatropic activity. (1) induce

apoptosis by binding to cell surface Fas or inhibit it by competitive

inhibition of ligand binding. (1) are used to treat and/or prevent

diseases associated with the Fas/Fas ligand system, especially systemic

clupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft

versus host disease, slorgen's syndrome, pernicious or hypoplastic

canemia, Addison's disease, sclercderm, docdpasture syndrome, Crohn's

disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,

multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin

dependent diabetes mellitus, allorsy, arteriosclerosis, myocarditis,

cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral

(B, C or D) or alcoholic), and transplant rejection. (I) selectively

inhibit apoptosis in normal cells but selectively induce it in abnormal

cells. They bind to both human and murine selectively induce it in abnormal her artive site of Fas, i.e. they mimic

the next induced the selective in the active site of Fas, i.e. they mimic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "MALLINE ALBERGE MODGESS. (1) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a murine anti-Fas antibody peptide fragment described in the method of the invention
                                                                                                                                                                                                                                                                                                       New humanized anti-Fas antibody, useful for treating or preventing e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
multiple sclerosis; Basedow's disease; thrombopenia purpura; allergy;
            insulin dependent diabetes mellitus, arteriosclerosis, myocarditis; cardiomyopathy, glomerulonephritis, hepatitis; transplant rejection.
                                                                                                                                                                                                                                                                                                                                     inflammatory or autoimmune disease, induces apoptosis selectively

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   용
```

```
The invention provides an antibody having affinity to CD4 antigen. The anti-buman CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. Sequences AAY59259-61 represent the complementarity determining region (CDR)-1, -2 and CDR-3 fragments in the L chain variable region of the antibody respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; mouse; Fas/Fas ligand system; Fas; antibody; light chain; heavy chain; apoptosis; antiallergic; immunosuppressive; apoptotic; autoimmune disease; allergy; atopy.

                                                                                                                                                                                                                     ö
                         The invention relates to a preventive or treating agent for diseases caused by abnormality in the FasFras ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a peptide useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polygeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining apecifically with mammalian Fas and an activity of inducing apportes is a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, at acpy and others. The present sequence is that of a peptide,
                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Drug containing humanized anti-Fas antibody, used for preventing and treating autoimmune diseases, allergy, and atopy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, mouse; humanised anti-Pas antibody, Fas/Fas ligand,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR86140-R66146 are peptides complementary to the variable region of the CD-4 antibody, these peptides are fixed onto a claimed nonwoven fabric (average fibre dia. of 1-30 microns) coated with keto-alkyl halide functional groups. This material can be used as a filter for CD-4 positive cells in a medical treatment involving the extra-corporeal circulation of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Material for collecting cells positive for CD-4 antibody - comprises nonwoven fabric having keto-alkyl halide functional gp.

Sequences of the invention are useful for preparing a pharmaceutical composition for treating human immunodeficiency virus (HIV) -infection or acquired immune deficiency syndrome (AIDS) or inflammatory and/or autoimmune diseases. They are used as vaccines and in gene therapy. The present sequence is MT413 modified VL protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chemokine,
 The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents the L chain variable region of the antibody 4H5.
                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New chemokine construct comprising scFV anti-CD4 and a RANTES chemokinseful for the preparing a composition for treating HIV-infection or inflammatory or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This sequence represents the light chain amino acid sequence of a mouse anti-human immunoglobulin E (IgE) antibody. The invention relates to a bispecific antibody that binds specifically to IgE when IgE is bound to its low affinity receptor (FCEL), but does not bind to IgE, when IgE is bound to its high affinity receptor (FCEH). The bispecific antibody comprises an IgE-binding arm with human framework residues of a recipient human antibody and donor murine CR (complementarity determining region) residues, but with at least one human antibodies work by displacing murine residue. The antibody also comprises an FV that is specific for a predetermined antigen other than IgE. The antibodies work by displacing bound IgE from its receptor, or via competitive inhibition of its binding. The bispecific antibodies are used for diagnosis, treatment and prevention of allergy and other IgE-mediated diseases, also, when it mmobilised, for the isolation of FCEL from cells (for research or therapy). The bispecific antibodies of the invention do not cause granulation or release of histamine from mast cells
                                                                                                                                                                                                                                                                                New bispecific antibodies, useful for treating immunoglobulin B-mediated disease, binds to IgE, but only when on the low affinity receptor, and to an antigen other than IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 106;

Murine monoclonal antibodies mu 39.1 and mu 5.5 both neutralise HIV. The heavy and light chain variable regions from these antibodies were sequenced (AAR55120-R55123). The murine anti-HIV CDRs were introduced into human framework regions to construct chimeric antibodies (AAR55124-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse-human chimeric anti-HIV antibody heavy and light chains - and recombinant antibody consisting of the H- and L-chains, useful in AIDS
been substituted a positionally analogous residue from a Kabat CD of the murine anti-huigE antibodies MAE11, MAE13, MAE15 or MAE17. (Updated on 25-MAR-2003 to correct PN field.)

The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic thinitis, conjunctivitis, atopic astima, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the disagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans. The present sequence represents the light chain variable region of Ig REI, and is used in the course of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New DNA molecules encoding recombinant antibodies useful for treating IL4

The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
allergic disorder, allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  늉

differentiation describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hemacopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived protein fragment which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cluster differentiation; cell separation; antibody; CD4; CD34; leukemia; hematopoietic; undifferentiated; lymphocyte; bone marrow transplantation; HIV infection; autoimmune disease; murine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions
                                              Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or CD34 and their use for
                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 79; DB 3; Length 111; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                             anti-human immunoglobuling E (195) antibody. The invention relates to a bispecific antibody that binds specifically to IgE when IgE is bound to its low affinity receptor (FCEL), but does not bind to IgE, when IgE is bound to its low affinity receptor (FCEH). The bispecific antibody comprises an IgE-binding arm with human framework residues of a recipient human antibody and donor murine CDR (complementarity determining region) residues, but with at least one human CDR residue replacing the analogous murine residue. The antibody also comprises an FV that is specific for a murine residue, the antibody also comprises an FV that is specific for bound IgE from its receptor, or via competitive inhibition of its bingecific antibodies are used for diagnosis, treatment and prevention of allergy and other IgE-mediated diseases, also, when the isolation of FCE from cells (for research or therapy). The bispecific antibodies of the invention do not cause granulation or release of histamine from mast cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                        New bispecific antibodies, useful for treating immunoglobulin E-mediated disease, binds to IgE, but only when on the low affinity receptor, and to an antigen other than IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cluster differentiation, cell separation, antibody, CD4; CD34; leukemia; hematopoietic; undifferentiated; lymphocyte; bone marrow transplantation; HIV infection; autoimmune disease; murine.
                                                                                                                                                                                                                                                                                                              This sequence represents the light chain amino acid sequence of a mouse

for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived protein fragment which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibody; antiasthmatic; antiallergic; ophthalmological; dermatological;
                                                                                                                                                                                                                                                                                                                                                                                             The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents a L chain fragment of the antibody 4H5.

This invention relates to a nucleotide sequence encoding an antibody with improved anti-IgE antibody activity. The antibody has improved action due to a process comprising, a) identifying aspartyl residues prone to isomerisation in unimproved anti-IgE (immunoglobulin E) antibody; b) substituting alternative residues to create candidate molecules, and c) selecting those candidate molecules which display affinity against the target molecule. Use of the antibody results in antiasthmatic; antiallergic; ophthalmological; dermatological and antiinflammatory antiallergic; ophthalmological; dermatological and antiinflammatory antiallergic ophthalmological; conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned to nucleic acids may also be used as affinity purification agents and in diagnostic assays for detecting the expression of an antigen of interest in specific cell, tissues or serum. Amino acid sequences AAB76935.

AAB76960 represent fragments of anti-IgE antibodies of the invention. Polymucleotide sequence AAF69253 repression plasmid used in the generation of affinity improved anti-IgE antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding anti-immunoglobulin E antibody with improved properties, produced by substituting aspartyl residues in unimproved immunoglobulin E prone to isomerization by other residues by affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to a method for treating an IgB-mediated disorder. The method involves administering a therapeutical amount of an anti-IgB antibody or its IgB binding fragment. The invention is useful for treating an IgB-mediated disorder e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies and hypersensitivity e.g. anaphylactic hypersensitivity. The present sequence is the murine MaB11 light chain variable region protein.
                                            Treating an IgB-mediated disorder, e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies, or hypersensitivity, by administering an anti-IgB antibody or its antigen-binding fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibody or its antigen-binding fragment specific to a vertebrate high mobility group box (HMGB) A box that inhibits release of a proinflammatory cytokine from a cell treated with HMGB protein, useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chemotherapy, IgE-mediated disorder; asthma; allergic rhinitis; eczema; urticaria; food allergy; hypersensitivity; anaphylactic hypersensitivity; antiasthmatic; antiallergic; dermatological; antibacterial; immune disorder; inflammation; ard disease; ince disease; throat disease; respiratory disease; antiinflammatory; dermatological disease;
                                                                                                                                                                                                                            New composition of an improved anti-1gE antibody or IgE binding fragment, useful for treating IgE-mediated diseases, e.g. atopic allergy, asthma, conjunctivitis, eczema, urticaria or food allergies.
                                                                                                                                                                                                                                                                                                                  The invention relates to therapeutic compositions comprising anti-IgE antibody or IgE binding fragment in combination with an adjunct immunosuppressive agent. The composition is useful for treating IgE-mediated disorders. The disorders include atopic allergy associated with anaphylactic hypersensitivity as athma, allergic rhinitis and conjunctivitis, eczema, urticaria and food allergies. The present sequence is murine anti-human IgE mAD MAE11 variable light chain domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention provides antibodies, or thear antigen-binding fragments, that bind to a vertebrate high mobility group box (EMGE) polypeptide, to methods of detecting and/or identifying an agent that binds to an HMGB polypeptide, methods of treating a condition in a subject characterized by activation of an inflammatory cytokine cascade, and methods of detecting an HMGB polypeptide in a sample. The antibody (or antigenbinding fragment) binds to a vertebrate HMGB hox but does not specifically bind to non-A box epitopes of HMGB, and inhibits release of a proinflammatory cytokine from a vertebrate cell treated with an HMGB captodin. A method of treating a condition characterized by activation of an inflammatory cytokine cascade comprises administering an antibody of the invention, or its antigen-binding fragment. The condition is selected temperatory distress syndrome, chronic obstructive pulmonary disease, psoriasis, pancreatitis, peritonitis, burns, ischemia, Behcet's disease, graft versus host disease, inflammatory bowel disease, multiple sclerosis and cachexia, especially sepsis, anthiritis, or lupus. The present sequence is that of the A box of human HMGB1. An identical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antibody (I) capable of binding human bendritic cell-Specific intercellular adhesion molecule (TCAM)-3 grabbing non-integrin (DC-SIGN) or recognizing DC-SIGN receptor on a cell, comprising an amino acid sequence having at least 80% homology to any one of 18 fully defined 4-10 amino acid sequences (ABB21889 to ABB2189). An antibody (I) capable of binding human DC-SIGN or recognizing a DC-SIGN receptor on a cell, is chosen from: an antibody (AI) capable of binding human DC-SIGN receptor on a cell; and an antibody (AA) capable recognizing a DC-SIGN receptor on a cell; and an antibody (AA) capable recognizing a bC-SIGN receptor on a cell; and an antibody (AA) capable recognizing a bC-SIGN receptor on a cell; AA effectively blocks binding of a virus to the cell, blocks infection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antibody; DC-SIGN; dendritic cell-specific ICAM-3 grabbing non-integrin; cancer; neoplasm; cytostatic; inflammation; antinflammatory; ectoparasite infection; antiparasitic; infection; viral infection; bacterial infection; antibacterial; virucide; autoimmune disease; immunosuppressive; immune discráer; allergy; antiallergic; immunotherapy; transplant rejection; humanized antibody; single chain antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antibody capable of binding or recognizing human dendritic cell-
specific intercellular adhesion molecule-3 grabbing non-integrin receptor
on cell, useful for treating cancer, and viral and bacterial infections.
                                                                                                                                  CDRs are mouse monoclonal antibody 0.5beta derived sequences. The anti-
HIV modified antibody can be used for the prophylaxis and treatment of
          New recombinant modified anti-HIV antibodies - comprise human x mouse modified antibody H and L chains.
                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                 framework regions (FR) are derived from the human antibody REI.
                                                                                                                                                                           AIDS. Specific examples of the H chain are given in AAR24556-58 and AAR24560-62. A specific example of the L chain is given in AAR24575

C cell to another cell, where the bacteria is chosen from Hailtochacter pylori, Klebsiella pneumoniae, Mycobacterium tuberculosis and M. bovis, and the parasite is chosen from Leishmania pignol and Schistosoma mansoni. Also described are: a vaccine comprising Al, a composition comprising Al and a carrier; a diagnostic agent (II) for a tumor characterized by increased DC-SIGN expression, comprising Al, treating a cancer characterized by increased DC-SIGN expression, comprising Al, treating a cancer characterized by increased DC-SIGN expression, comprising Al, treating a cancer characterized by increased DC-SIGN expression, comprising Al, treating C cancer, involves administering to a subject, a demdritic cell xilling amount of a composition comprising Al, and treating (M2) an inflammatory disease, which involves administering to a subject, a demdritic cell xilling amount of a composition comprising Al. Al further comprises a period extended to it. The peptid accomprises an antigen, where the peptid extended to it. The peptid accomprises an antigen, where the peptid extended to it. The peptid accomprises an antigen, where the period extended to it. The peptid accomprises an antigen, where the antibody or an scrope cransmitting virus, also binds to L-SIGN (I) is useful in interaction of DC-SIGN expressing cells and ICMA-expressing cells, which involves administering immune-modulating amount of (I), to a subject. (I) is useful for generating an immune response, which involves administering immune-modulating amount of (I), to a subject suspected of having cancer, which antigen to (I). (I) is useful for delivering an antigen to (I). (I) is useful for delivering an antigen to (I). (I) is useful for the presence of cancer. The determining a tissue sample from a subject suspected of having concer, which harvigen to (I). (I) is useful for blocking infection of the cell virus, bacteria or parasite to the cell blocking infection of the coll virus, bacteria or parasite from the cell coll to the cell virus, bacteria or paras
                            to another cell, where the virus is chosen from HIV, hepatitis C virus (HCV), Ebbla, severe acute respiratory syndrome (SARS), cytomegalovirus (CMV), Sindbis and Dengue, or effectively blocks binding of a bacteria or parasite to the cell, blocks infection of the cell by a bacteria or parasite, and/or blocks transmission of a bacteria or parasite, and/or blocks transmission of a bacteria controlled to another cell, where the bacteria is chosen from Helicobacter
the cell by a virus, and/or blocks transmission of a virus from the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              dendritic cells and/or their function and interaction, studying immune system and for detecting dendritic cells and/or C-type lectins in biological samples.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tolerance, immunotherapy, and in diagnostic and research for studying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antibody, light chain, SEQ ID NO:44.
```

The present sequence was used in a method for designing a mimetic which exhibits an activity associated with a parent molecule. Such mimetics may be smaller than the parent molecule and correspondingly easier and cheaper to make, since the active region of the parent molecule is normally relatively small. The method is useful where the parent molecule is a binding domain or the hypervariable region of an antibody or other member of the immunoglobulin superfamily. It is useful when the parent molecule is an antibody and the mimetic a peptide, especially an antibody which binds CD4. The mimetics designed and produced are useful diagnostically to detect cells bearing CD4 on their surfaces or may be included in pharmaceuticals e.g. to treat conditions in which CD4 is implicated (e.g. HIV)

Designing molecular mimetics to mimic a parent molecule activity, useful e.g. therapeutically and diagnostically, uses computational screening to identify active chemical groups by accessibility within the parent

This invention relates to a novel humanised antibody or antibody fragment which binds to an epitope on an envelope glycoprotein of the Venezuelan equine encephalitis virus, and comprises at least one complementary determining region (CDR) from a non-human antibody and at least one framework region from a human antibody. The invention may be useful for the production of compounds with a virucide activity or vaccines. The humanised antibody is useful for preventing or neutralising viral infection. The present sequence is that of a HY4 26 light chain protein which was used in the exemplification of the invention.
                                                                                                                                                 New humanized antibody or antibody fragment comprising at least one complementary determining region from a non-human antibody and at least one framework region from a human antibody, useful for preventing viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          humanised antibody; epitope; envelope glycoprotein; Venezuelan equine encephalitis virus; complementary determining region; CDR; non-human antibody; framework region; virucide; vaccine; viral infection; human; 384C4 HY4; light chain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for producing antibody enzymes comprising a structural analysis step which confirms the existence in the predicted stereostructure of the antibody based on its amino acid sequence of a catalytic triplet residue structure in which a serine residue, an aspartic acid residue, and a histidine or glutamic acid by the method of the invention has virucide, anti-HIV, cytostatic, and antibacterial activity. The enzyme acts as a helicobacter pylori urease inhibitor, or chemokine receptor CCR-5 (HIV target) antagonist. The method of the invention is useful for the treatment, prevention and diagnosis of cancer and infectious diseases, especially infection by Helicobacter pylori or HIV. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                        Screening potential antibody enzymes by identification of a catalytic triplet residue in the stereostructure for production of antibody enzymes as diagnostic and therapeutic agents for cancer and infectious diseases including HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Virucidal antibody-related HY4 26a light chain protein sequence SeqID91.

This invention relates to a novel humanised antibody or antibody fragment
                    which binds to an epitope on an envelope glycoprotein of the Venezuelan equine encephalitis virus, and comprises at least one complementary determining region (CDR) from a non-human antibody and at least one framework region from a human antibody. The invention may be useful for humanised antibody is useful for preventing or neutralisating viral infection. The present sequence is that of a human 38404 HV4 light chain protein which was used in the exemplification of the invention.

humanized antibody or antibody fragment comprising at least one slementary determining region from a non-human antibody and at least framework region from a human antibody, useful for preventing viral New humanized antibody complementary Infection.

Example; SEQ ID NO 93; 70pp; English.

This invention relates to a novel humanised antibody or antibody fragmen which binds to an epitope on an envelope glycoprotein of the Venezuelan equine encephalitis virus, and comprises at least one complementary determining region (CDR) from a non-human antibody and at least one framework region from a human antibody. The invention may be useful for the production of compounds with a virucide activity or vaccines. The humanised antibody is useful for preventing or neutralising viral infection. The present sequence is that of a HY4 26 light chain protein which was used in the exemplification of the invention.

CPGR is a portion of HIV-1 gpl20 or gpl60 protein. Monoclonal antibodies (MAbs) that react with this and which have the capacity to neutralise the infection of H9 cells in culture by live HIV-1 strains MN and IIIB are claimed. Specifically illustrating the invention are the murine MAD (designated NN-01) produced by hubridoma cell line HB 10726 which is deposited under APCC No. HB 10726. The DNA sequences of the variable regions of the heavy and light chains of MAD NN-01 were cloned by PCR using cDNA generated from hybridoma HB 10726 cytoplasmic RNA as template. The DNA was then sequenced. The DNA and deduced AA sequences are given in AAD56688/R48615. Resequencing the variable regions of MAD NN-01 resulted in the sequences set out in AAD5668/R48616. The heavy chain variable region of NN-01 differs from AAO5688/R48616. The heavy chain variable regions of these CDC and of 120 The 11ght chain variable regions of these two Abs differ by contain variable regions of these chose in the sequences of the three CDRs in the heavy chain (V-H) of the NAC BAT123, while the sequences of the three CDRs in the light chain (V-L) cvary by about 29-4% compared to NM-01. A humanized antibody light chain variable region and signal sequence is given in AAR75355. The signal sequence is also provided in AAR70194. The sequences of the 3 CDRs are identical to mouse anti-human II-4 MAD 3B9 light chain CDRs (given in AAR70195-97). (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                    A humanized antibody light chain variable region and signal sequence is given in AAR75355. The signal sequence is also provided in AAR70194. The sequences of the first 2 CDRs are identical to mouse anti-human IL-4 MAb 3B9 light chain CDRs (given in AAR70195-96), but the third (AAR70201) differs by a single amino acid from the native mouse CDR (AAR70197). (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents the light chain variable region of a humanised murine interleukin-4 (IL-4) antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The compositions of the invention are used in therapeutic and pharmaceutical antibodies of the invention are used in therapeutic and pharmaceutical altergic reactions e.g. allergic rehinitis, conjunctivitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New DNA molecules encoding recombinant antibodies useful for treating IL4-mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Light chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; mamunoglobulin B-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic aesthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy.

```
This sequence represents the light chain of the humanised 189 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                              Recombinant IL4 antibodies useful for tratment of allergic rhinitis, atopic ashthma and anaphylactic shock.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            humanised murine interior. (IL-4) antibody 3B9. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                New DNA molecules encoding recombinant antibodies useful for treating IL4 -mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibody, interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allaregic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.
